

6133

Apply plastic mulch to raised beds already made

Choices for 3-row application

Three mulch layer units float independently with rear gauge wheels for smoothest finish and most consistent mulch coverage.

This equipment can be scaled with features for pounding field work on wholesale production farms or for fresh-market growers expanding to three-row. See features at right for details.

With three side-by-side layer units, mulch width can be as wide as 12" less than mulch row spacing. For wider mulch, or narrower furrows, alternating layer units are possible. Toolbar widths are made-to-order to match your row system.

Bedder-Layer Combos

Heavy-duty 3-row Bedder-Layer Combination models are also available. Like one-row combos, field conditions need to be ideal and soil worked deep.

Complete solutions with separate bed shapers and mulch layers for best soil management

6133 features ball bearing on disks and wheels, poly rollers on roll carriage.

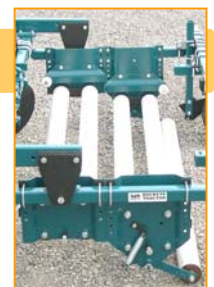

8133 features tapered bearing hubs on disk and wheels, steel rollers on roll carriages with ball bearings.

Options

Drip tape application
