

CLEAN PLASTIC REMOVAL

Remove plastic mulch or drip tape fast and efficient with basic planning and management. Choice of tools largely depends on the amount of investment versus level of mechanization. Customize plastic removal as needed when manual labor becomes prohibitive.

Mulch Lifters are essentially heavy tillage tools to loosen soil along plastic edges from underneath. Cut through vines, residue, weeds and soil compaction in the toughest field conditions and to leave a clean field without tearing plastic. Winders can be used to roll-up material into bundles one person can carry.

Mulch Lifters can be dedicated to that job or perform additional field work with the multi-use toolbar. Set-up a cultivator for tillage between mulch rows, a bed lifter to harvest garlic or onions OR set-up a chisel plow for deep post-harvest tillage, which names a few possibilities. Get a big bang for your buck.

For plastic mulch or drip tape

Expect a clean field

Multi-purpose toolbars

Fully adjustable

Split mulch down the middle to pull each half away from the row, which is fundamental to roll off soil and debris. The loose plastic on top of the ground can be gathered by hand or rolled up by machine.
