

5337-M CONTINUED

The beefy 3-point hitch is built for tractors up to 80 HP, providing many applications for plastic mulch OR drip tape. Tape lifters can be built on smaller toolbars but experience has proven otherwise. Tape lifters often need the extra iron to fracture compaction, typically when no plastic mulch covered it. Winders can be mounted on the rear for one pass tape removal.

TYPICAL SHANK SET-UP FOR DRIP TAPE

To loosen drip tape, equip with a single shank beside the tape line for lighter soil conditions. Or place a shank on each side of line to ensure full soil fracture over the tape. A blade under the tape is usually not needed. Add-on ripper wings can supplement fracture, if needed. We adapt to your field conditions.

The open-center frame (left) is available to freely place many attachments without conflict with hitch parts.
