TOOLBAR SYSTEMS

A toolbar mainframe provides a solid backbone that's also versatile to install and adjust attachments. Each machine can be dedicated to one purpose OR a toolbar can be used for different jobs. Small farm operators have just as much need for field tools so toolbars and attachments can be shared to set-up additional machines.

1073

The 1063 toolbar features three 2" square toolbars at 12" spacing and used on the bed shaper and cultivator. The 1001 / 20102 toolbar combination is used on the mulch layer and wheel planter. Hilling disks and wheel punchers are mounted on the 1001 or 1063. The ripper and furrower are mounted to the 1001. The 1072 and 1073 are most versatile for a row crop cultivator and all above attachments can be mounted on it with some additional mounting hardware. 1072 features two toolbars for the simplest row crop set-ups

This bed shaper toolbar has the pan removed and hilling disks adjusted to hill potatoes

MULTI-TOOL KITS

Multi-Tool Kits are a great way to maximize investment or simply do more with less. Most re-assembly of machines is less than a half-hour with a little organization and some appreciation for wrenches. If time becomes short, buy additional toolbars to keep equipment set-up. Regardless, this helps develop a greater understanding of machinery in general.
